

CODERAXO

Web Development Internship Program

PROGRESS REPORT

Weeks 1 – 3

Intern Name: Aqsa Aslam

Offer Reference: CAX-OL-2026-310

Reporting Period: June 15 – July 5, 2026

Track: HTML5 → CSS3 → JavaScript Fundamentals

Submitted as part of the CoderAxo Web Development Internship weekly reporting cycle.

Executive Summary

The first three weeks of the internship covered the foundational front-end stack — HTML5, CSS3, and core JavaScript — moving from static, semantic markup through to a fully responsive, interactive personal portfolio site (Task 1). Each week built directly on the previous one: HTML structure from Week 1 became the base that Week 2's Flexbox/Grid layouts were applied to, and that same styled structure was then made interactive with the JavaScript concepts learned in Week 3.

By the end of Week 3, Task 1 — a complete personal portfolio built with vanilla HTML, CSS, and JavaScript — was planned, built, and submitted on schedule, establishing a working pattern of planning a section layout before writing code that carried into later tasks.

Objectives Covered

- Understand internship structure, weekly submission cycle, and expectations (orientation)
- Master semantic HTML5 structure, forms, and accessibility basics
- Learn Flexbox and Grid well enough to choose the right layout tool for a given problem
- Build a working command of core JavaScript — variables, functions, DOM, and events
- Apply Weeks 1–3 skills together to plan, build, and ship Task 1 (Personal Portfolio) on schedule

Weekly Breakdown

Week	Dates	Focus Area	Key Deliverable
Week 1	Jun 15 – Jun 21	Orientation & HTML5 Foundations	Semantic HTML practice pages, forms, accessibility basics
Week 2	Jun 22 – Jun 28	CSS3, Flexbox, Grid & Responsive Design	Restyled Week 1 pages with Flexbox/Grid, fully responsive
Week 3	Jun 29 – Jul 5	JavaScript Fundamentals & Task 1	Task 1: Personal Portfolio (HTML/CSS/JS) submitted

Week-by-Week Detail

Week 1 — Orientation & HTML5 Foundations

The internship began with a Zoom orientation covering the program roadmap (HTML → CSS → JS → Node.js → React → Final Project) and the weekly submission process. The technical sessions that followed re-established HTML5 fundamentals with an emphasis on semantic tags (header, nav, main, section, article, aside, footer) in place of generic div-based markup, along with accessible forms, tables, and lists. The week closed with a static, unstyled practice page covering everything learned.

Week 2 — CSS3, Flexbox, Grid & Responsive Design

Week 2 covered CSS selectors, specificity, and the box model, then moved into sizing units and the two core layout systems: Flexbox for one-dimensional alignment (navbars, card rows) and CSS Grid for two-dimensional layouts (galleries). Positioning and basic transitions rounded out the week. The Week 1 pages were then fully restyled using Flexbox and Grid and made responsive with media queries, including tracking down a Flexbox vertical-centering bug caused by a missing container height.

Week 3 — JavaScript Fundamentals & Task 1

JavaScript sessions covered variables, functions, control flow, DOM selection/manipulation, and event handling. Midway through the week, Task 1 (Personal Portfolio) was assigned. The build was planned on paper first — Hero, About, Skills, Projects, Contact sections — then implemented with a JS-powered mobile navigation toggle and a scroll-based active-link highlight, and submitted on schedule.

Tools & Technologies Used

- VS Code, Live Server extension, Chrome DevTools
- Git (basic local commits)
- HTML5, CSS3 (Flexbox, Grid, custom properties)
- Vanilla JavaScript (ES6)
- Zoom (live orientation and sessions)

Key Challenges & Resolutions

- Breaking the habit of wrapping everything in generic divs — resolved by deliberately choosing the correct semantic tag each time until it became natural.
- Flexbox items not vertically centering in the navbar — traced to the parent container having no explicit height, since align-items has nothing to center against otherwise.
- Getting the scroll-based active-link highlight to trigger at the right point — resolved by checking each section's bounding position against scroll position with a small buffer.

Reflection

These three weeks made it clear that HTML, CSS, and JavaScript are not three separate skills practiced in isolation but one continuous discipline — each layer depends on the one below it. Planning before building (sketching sections, choosing Flexbox vs. Grid deliberately, structuring JS into small functions) consistently produced faster, cleaner results than improvising. Shipping Task 1 on time was a strong confidence boost heading into the more complex application work that followed in Week 4.

Goals Going Forward

- Start Task 2 (To-Do App) and get comfortable with localStorage
- Practice array methods (map, filter) more deliberately instead of manual loops
- Carry forward the habit of planning structure before writing code
