

# Progress Report

*Covering Weeks 1 – 3 (June 15 – July 5, 2026)*

---

**Intern:** Aqsa Aslam

**Program:** CoderAxo Web Development Internship

**Offer ID:** CAX-OL-2026-310

**Report Date:** July 6, 2026

## Summary

---

The first three weeks of the internship covered the front-end foundations that everything else in the program builds on: HTML, CSS, and JavaScript. Sessions were held live over Zoom, followed by hands-on practice, and the phase closed with Task 1 – a personal portfolio website built independently using only HTML, CSS, and JavaScript. Overall, this phase went smoothly and gave a solid base to move into more advanced topics.

## Work Completed

---

- Week 1: HTML5 fundamentals – semantic structure, forms, tables, and accessible markup
- Week 2: CSS fundamentals – box model, Flexbox, Grid, positioning, and responsive design with media queries
- Week 3: JavaScript fundamentals – variables, functions, DOM manipulation, events, arrays, and objects
- Task 1 (Personal Portfolio): planned, built, and submitted a responsive multi-section portfolio site (About, Skills, Projects, Contact) with a JS-powered navigation toggle

## Skills Gained

---

- Writing clean, semantic HTML instead of relying on generic div structures
- Building fully responsive layouts using Flexbox and CSS Grid together
- Manipulating the DOM and handling events with vanilla JavaScript
- Structuring and shipping a small multi-section project independently, start to finish

## Challenges Faced

---

The main challenge was purely a pacing one – moving from static HTML/CSS to interactive JavaScript within the same week the portfolio task was assigned meant applying new concepts almost immediately. A minor Flexbox alignment bug in Week 2 (a navbar not centering vertically) also took some trial and error to track down to a missing container height.

## Goals for the Next Phase

---

- Get more comfortable with JavaScript logic through the upcoming To-Do App task
- Build a working understanding of Node.js and backend fundamentals
- Start React with a stronger JS foundation already in place
