

Week 2 Activity Log

CSS Fundamentals & Responsive Layouts

Intern: Aqsa Aslam

Program: CoderAxo Web Development Internship

Offer ID: CAX-OL-2026-310

Week Duration: June 22 – June 28, 2026

Overview

Week 2 moved on to CSS. The sessions built up from basic selectors to full layout systems, and most of the week was spent styling the HTML pages built in Week 1 so they actually looked like something.

Activities Completed

- Live session covering selectors, specificity, the box model, and common units (px, %, em, rem)
- Practiced Flexbox for one-dimensional layouts – navbars, card rows, and centering content
- Practiced CSS Grid for two-dimensional layouts, including a simple grid-based gallery
- Learned positioning (relative, absolute, fixed, sticky) and when to use each
- Covered transitions and basic hover/focus states to make pages feel more interactive
- Restyled the Week 1 HTML pages using Flexbox and Grid, and made them responsive using media queries

Key Learnings

- How Flexbox and Grid solve different layout problems and when to reach for which one
- Mobile-first responsive design using media queries
- How specificity conflicts happen and how to avoid overusing !important

Notes

Got stuck for a bit on a Flexbox alignment issue where items were not centering vertically inside a nav bar – turned out to be a missing height on the parent container. Small mistake, but it took a while to catch.
