

Week 7 Activity Log

Task 3 – React Countries App & Final Project Build (Phase 1)

Intern: Aqsa Aslam

Program: CoderAxo Web Development Internship

Offer ID: CAX-OL-2026-310

Week Duration: July 27 – August 2, 2026

Overview

This week ran two tracks in parallel: completing Task 3, a deployed React application, and starting active development on the Final Project.

Activities Completed

- Task 3 assigned: build and deploy a complete React application with functional routing, real API data, and Tailwind CSS styling
- Built a Countries explorer app in React – Home, Country detail, About, Contact, and a 404/Error page, wired together with React Router
- Fetched and rendered live country data, including search and detail views for each country
- Styled the app with Tailwind CSS and made it fully responsive
- Deployed the finished app and submitted the live link along with the source code
- Started Final Project development using a vertical-slice approach – building backend and frontend together, module by module
- Set up the MERN project structure: Express + MongoDB Atlas on the backend, React + Vite on the frontend
- Built and completed the Authentication module – registration and login with JWT, bcrypt password hashing, an AuthContext on the frontend, and a protected Dashboard route

Key Learnings

- Fetching and rendering real API data in React, including handling loading and error states
- Structuring a multi-page React app cleanly with React Router
- Setting up JWT-based authentication end to end (hashing, signing tokens, and protecting routes)

Notes

Balancing Task 3 and the start of the Final Project in the same week meant longer working sessions, but finishing the Auth module first gave a solid, working foundation to build the rest of the Final Project on top of.
