

Week 1 Activity Log

Orientation & HTML5 Foundations

Intern Name: Aqsa Aslam

Internship Program: CoderAxo Web Development Internship

Offer Reference: CAX-OL-2026-310

Week Duration: June 15 – June 21, 2026

Week Overview

My first week at CoderAxo was less about writing a lot of code and more about getting oriented — understanding how the internship is structured, what's expected week to week, and getting my footing back in HTML before things pick up pace. The internship officially kicked off with a Zoom orientation session where the mentor walked the whole batch through the program timeline, the weekly submission cycle (activity logs, progress reports, and graded tasks), and the general ground rules for communication and deadlines. Once that was out of the way, the technical portion of the week began, and HTML5 was the starting point.

Objectives for the Week

- Understand the internship's overall structure and how weekly submissions work
- Refresh core HTML5 knowledge and adopt a more semantic approach to markup
- Get comfortable building simple structured pages without relying on any CSS or JS yet

Daily Activity Breakdown

Mon, Jun 15

Attended the CoderAxo orientation call on Zoom. Went over the internship roadmap (HTML → CSS → JS → Node.js → React → Final Project), the submission dashboard, and expectations for weekly reporting.

Tue, Jun 16

First technical session: HTML5 document structure, doctype, head/body, and the difference between block and inline elements. Practiced with a blank page rebuilt from scratch.

Wed, Jun 17

Covered semantic tags — header, nav, main, section, article, aside, footer — and why they're preferred over generic div-based markup.

Thu, Jun 18

Built HTML forms: input types, labels, select dropdowns, textareas, and required/pattern validation attributes.

Fri, Jun 19

Worked with tables and nested/ordered/unordered lists for structured content; practiced accessibility basics like alt text and proper label associations.

Sat, Jun 20

Built a static multi-section practice page (About + Contact layout) using only the tags covered this week, with no styling yet.

Sun, Jun 21

Reviewed the week's notes, cleaned up the practice HTML files, and prepared the Week 1 Activity Log for submission.

Detailed Summary

Most of this week's actual coding time went into re-learning HTML the 'right' way — I had used it before in coursework, but mostly with generic div wrappers rather than semantic tags. Rebuilding a couple of practice pages using header, nav, section, and footer instead of stacked divs made the markup noticeably easier to read on its own, even before any CSS was added. I also spent extra time on forms since I hadn't previously paid much attention to input types (email, tel, number) or built-in validation attributes like required and pattern — small things, but they save a lot of extra JavaScript validation work later.

Tools & Technologies Used

- VS Code
- Live Server extension
- Chrome DevTools (Elements panel)
- Zoom (live sessions)

Skills & Concepts Learned

- Semantic HTML5 structure and when to use each landmark tag
- Building accessible forms with correct label-input associations
- Reading and debugging markup using the browser's Elements panel

Challenges Faced & How I Resolved Them

Nothing here was conceptually difficult, but I did have to consciously stop myself from falling back on old habits — wrapping everything in a div because it was faster. Forcing myself to pick the correct semantic tag each time took a bit longer than just guessing, but it paid off once I compared the readability of the final markup against how I would have written it before this internship.

Reflection

Week 1 was a good reset. It reminded me that 'knowing HTML' and 'writing HTML the way a real project should be structured' are two different things, and that the second one is really a habit you build deliberately rather than something that happens automatically with experience.

Goals for Next Week

- Move into CSS and start styling the pages built this week
- Learn Flexbox and Grid properly instead of relying on trial-and-error positioning

- Start thinking about responsive design from the beginning rather than as an afterthought
