

Week 2 Activity Log

CSS3, Flexbox, Grid & Responsive Design

Intern Name: Aqsa Aslam

Internship Program: CoderAxo Web Development Internship

Offer Reference: CAX-OL-2026-310

Week Duration: June 22 – June 28, 2026

Week Overview

Week 2 was where the pages from last week finally started looking like actual webpages. The sessions moved through CSS fundamentals fairly quickly and spent the bulk of the time on the two layout systems that matter most in real projects — Flexbox and Grid — along with getting the pages to behave properly across different screen sizes.

Objectives for the Week

- Learn Flexbox and Grid well enough to choose the right one for a given layout problem
- Understand the CSS box model and specificity instead of guessing at style conflicts
- Make the previous week's static pages fully responsive

Daily Activity Breakdown

Mon, Jun 22

Submitted Week 1 log. Session on CSS selectors, specificity rules, and the box model (content, padding, border, margin).

Tue, Jun 23

Covered sizing units — px, %, em, rem, vh/vw — and when each one actually matters versus when it's just preference.

Wed, Jun 24

Deep dive into Flexbox: main/cross axis, justify-content, align-items, flex-grow/shrink, and building a responsive navbar.

Thu, Jun 25

Learned CSS Grid — grid-template-columns/rows, gap, and grid-area — and built a simple image gallery layout.

Fri, Jun 26

Covered positioning (relative, absolute, fixed, sticky) and basic transitions/hover states for interactivity.

Sat, Jun 27

Restyled the Week 1 HTML pages fully using Flexbox and Grid; added media queries to make the layout responsive on mobile widths.

Sun, Jun 28

Fixed a Flexbox centering bug in the navbar, tested the pages at different breakpoints, and wrote up the Week 2 log.

Detailed Summary

The biggest shift this week was realizing Flexbox and Grid solve different problems — Flexbox for one-dimensional rows/columns like a navbar or a card row, and Grid for actual two-dimensional layouts like a gallery. Once that distinction was clear, choosing between them stopped being a guessing game. I spent a good chunk of Saturday rebuilding the Week 1 pages with proper layout instead of the rough draft styling I'd first tried, and adding media queries so the same markup adapted cleanly from a wide desktop layout down to a single-column mobile view.

Tools & Technologies Used

- VS Code
- Chrome DevTools (responsive design mode)
- CSS Grid/Flexbox inspector in DevTools

Skills & Concepts Learned

- Building layouts with Flexbox for one-dimensional alignment problems
- Using CSS Grid for structured, two-dimensional layouts like galleries
- Writing mobile-first responsive CSS using media queries
- Debugging specificity conflicts instead of reaching for !important

Challenges Faced & How I Resolved Them

Ran into a Flexbox bug where items inside the navbar weren't centering vertically no matter what alignment property I changed. After a while, the issue turned out to be a missing explicit height on the parent flex container — align-items has nothing to vertically center against if the container is only as tall as its content. Once I gave the navbar a fixed height, it resolved immediately.

Reflection

This was the first week where a bug actually cost real time, and it taught me to check the parent container's dimensions before assuming the alignment property itself is wrong. Small lesson, but one I've referred back to since.

Goals for Next Week

- Start JavaScript fundamentals and begin planning Task 1 (the portfolio site)
- Get comfortable with DOM manipulation basics before the task is assigned
- Keep practicing responsive layouts so they become quicker to build
