

Week 3 Activity Log

JavaScript Fundamentals & Task 1 – Personal Portfolio

Intern Name: Aqsa Aslam

Internship Program: CoderAxo Web Development Internship

Offer Reference: CAX-OL-2026-310

Week Duration: June 29 – July 5, 2026

Week Overview

This was the first week that felt like real programming rather than styling and structure. JavaScript sessions covered the core language, and about midway through the week, the first hands-on task was assigned: build a complete personal portfolio website using nothing but HTML, CSS, and JavaScript.

Objectives for the Week

- Build a working understanding of core JavaScript — variables, functions, DOM, and events
- Apply everything from Weeks 1–3 together in one real, multi-section project
- Ship Task 1 (personal portfolio) on schedule with clean, responsive code

Daily Activity Breakdown

Mon, Jun 29

Session on JavaScript basics — let/const, data types, operators, template literals, and control flow (if/else, loops).

Tue, Jun 30

Covered functions and arrow functions, including differences in behaviour (this binding, implicit returns).

Wed, Jul 1

DOM selection and manipulation — querySelector/querySelectorAll,.textContent/innerHTML,classList, and creating elements dynamically.

Thu, Jul 2

Event handling — click, submit, and input events, addEventListener, and basic event delegation. Task 1 assigned at the end of the session.

Fri, Jul 3

Planned the portfolio: sketched the section layout (Hero, About, Skills, Projects, Contact), gathered content/images, and set up the file structure.

Sat, Jul 4

Built out the portfolio's HTML/CSS across all sections and added a JS-powered mobile navigation toggle.

Sun, Jul 5

Added a scroll-based active-link highlight with JavaScript, tested responsiveness, fixed small bugs, and submitted Task 1 along with the Week 3 log.

Detailed Summary

The portfolio task was the first time in the program where HTML, CSS, and JS all had to work together in one project rather than being practiced in isolation. I planned the sections on paper before writing any code — Hero, About, Skills, Projects, Contact — which made the actual build much faster since I wasn't deciding on structure and writing code at the same time. The JavaScript part was fairly small in scope (a mobile nav toggle and a scroll-based active link highlight) but it was the piece that made the site feel like an actual product instead of a static document.

Tools & Technologies Used

- VS Code
- Vanilla JavaScript (ES6)
- Git (basic local commits)
- Chrome DevTools (Console + Elements)

Skills & Concepts Learned

- Core JavaScript syntax — variables, functions, arrow functions, and control flow
- Selecting and updating the DOM in response to user interaction
- Handling events (click, scroll) and writing small, reusable functions
- Planning a multi-section page before writing code, instead of building and restructuring as I go

Challenges Faced & How I Resolved Them

Getting the scroll-based active-link highlight to trigger at the right point (rather than a section early or late) took a few rounds of tweaking scroll offset values. I eventually settled on checking each section's bounding position against the current scroll position with a small buffer, which fixed the timing issue.

Reflection

This week made it obvious how much HTML, CSS, and JS depend on each other in practice — a portfolio isn't really three separate skills, it's one project that happens to use three languages. Finishing and submitting Task 1 on time, with all three working together cleanly, was a good confidence boost heading into the next, harder task.

Goals for Next Week

- Start Task 2 (the To-Do App) and get more comfortable with localStorage
- Practice array methods (map, filter) more deliberately instead of writing manual loops
- Keep the mobile navigation pattern from the portfolio in mind for future projects
