

## Week 8 Activity Log

*Final Project Completion, Documentation & Submission*

---

**Intern Name:** Aqsa Aslam

**Internship Program:** CoderAxo Web Development Internship

**Offer Reference:** CAX-OL-2026-310

**Week Duration:** August 3 – August 9, 2026

### Week Overview

---

The last full working week went almost entirely into finishing the Final Project — the Project & Team Collaboration System — building out every remaining module, securing the application, and preparing all the documentation CoderAxo required before the August 5 deadline.

### Objectives for the Week

---

- Complete every remaining module of the Final Project without breaking what Authentication and earlier modules already had working
- Apply consistent security practices across the entire application rather than only the Auth module
- Produce every required submission artifact — README, API docs, ER diagram, demo video, and final report — to a professional standard

### Daily Activity Breakdown

---

#### Mon, Aug 3

Built the Dashboard module — summary cards, task-status distribution chart, and a recent-activity feed pulling from the backend.

#### Tue, Aug 4

Built Team Management (create team, add members, assign roles) and Project Management (full CRUD with status tracking).

#### Wed, Aug 5

Built the Kanban Task Board (Todo/In Progress/Review/Completed with drag-and-drop status updates); final testing pass; submitted the completed core project before the deadline.

#### Thu, Aug 6

Built the File Sharing module (drag-and-drop uploads, file list per project) and the Notifications module for team/task activity alerts.

#### Fri, Aug 7

Applied security hardening across the app — input validation on every form, authorization checks on protected routes, and a review pass against injection/XSS risks.

#### Sat, Aug 8

Wrote the README (setup/installation instructions), compiled the API documentation, and generated the ER diagram from the finalized schema.

### Sun, Aug 9

Recorded the project demo video, compiled the Final Project Report, uploaded the build to Google Drive, pushed the final code to GitHub, and wrote up the Week 8 log.

## Detailed Summary

---

With Authentication already solid from the previous week, this week was about layering the remaining modules on top without regressing what already worked — a real risk once Dashboard, Teams, Projects, and Tasks all started reading from and writing to the same collections. Testing each new module against the existing ones as it was added, rather than only testing it in isolation, caught a couple of issues early (a project delete not cascading to its tasks, for one) that would have been much harder to trace once everything was finished. The last two days were almost entirely documentation and packaging — writing a README clear enough that someone with zero context could set the project up, documenting every API route, and recording a demo that actually shows the working features rather than just narrating over static screenshots.

## Tools & Technologies Used

---

- Full MERN stack (MongoDB, Express.js, React, Node.js)
- Framer Motion, Recharts (Dashboard UI)
- Git & GitHub
- Draw.io (ER diagram)
- Loom/OBS (demo recording)
- Google Drive (build upload)

## Skills & Concepts Learned

---

- Taking a set of separate modules and integrating them into one cohesive, cross-tested application
- Applying security practices (validation, authorization, safe password storage) consistently across an entire codebase
- Writing documentation (README, API docs) clear enough for someone outside the project to follow
- Managing a hard deadline by prioritising which features to finish and polish first

## Challenges Faced & How I Resolved Them

---

The cascading-delete bug (deleting a project left its tasks orphaned in the database) was the trickiest issue of the week, and only showed up because of cross-module testing rather than testing Projects and Tasks separately. There was also a late scare with the file upload feature exceeding a default body-size limit in Express, fixed by explicitly configuring the body-parser and multer limits before the deadline.

## Reflection

---

Submitting the completed Final Project — every module working, documented, and demoed — ahead of the deadline was the most satisfying moment of the internship so far. It was also a clear demonstration of everything from Weeks 1 through 7 coming together in one real, working product rather than eight separate, disconnected exercises.

## Goals for Next Week

---

- Prepare the Final Internship Report and the One-Page Reflective Summary
- Submit the Internship Certificate/Experience Letter once issued by CoderAxo
- Carry the vertical-slice, document-as-you-go workflow from this project into future work
